

The country's flour consumption is 11 million tons, and despite the production of 25 million tons of flour, we have a good export capacity

Chairman

of the Association of Flour and Bread Centers said: We cannot export due to currency fluctuations and customs problems that have been created for the transit of wheat, and our export share has fallen. Turkey, Russia and Uzbekistan have easily filled our presence.

Hossein

Yazdjerdi, director of the Association for Flour and Bread, said at a press conference today at Iran State Trading Corporation: "Before the revolution, the flour storage capacity was 4.5 million tons, which was done with heavy mills after the revolution due to them being insanitary. Some of these mills have been converted to roller mills and have reached 25 million tons by today.

He added: "We have introduced good technologies and machines from the best countries in the world and now Iran is

among the 10 countries in the world in terms of technology.

Yazdgerdi

continued: "In cooperation with the Ministry of Industry, we produced some machinery in the country and export to countries such as Azerbaijan, Turkmenistan and Russia." The country's flour consumption is 11 million tons, and despite the production of 25 million tons of flour, we have a good export capacity.

He

acknowledged that before the revolution, our modern factories also lacked a laboratory, but since 1368 factories must have a laboratory obligatory. After the presence of the laboratory, the presence of the technical officer in the factories was forced to make progress in the industry.

"There

was no standardization in wheat, and bread storage," he said. Still, this is not the first and last part of this standard chain, but the flour segment is standardized and its standards are international, if these standards are not met in factories, they will be subject to fines.

Yazdgerdi

pointed to the export of flour to Iraq: Last year, 500,000 tons of flour was exported to Iraq, but foreign exchange fluctuations caused an export problem.

We did not get this market easily, but we cannot export due to currency

fluctuations and customs problems that have been created for the temporary clearance of wheat, and our export share has fallen. Turkey, Russia and Uzbekistan have easily filled our presence.

Following the meeting, Ali Khanmohammadi, the secretary of the Association of Manufacturers and Importers of Industrial Bread, remarked: "We have good machinery and the raw materials we had previously imported from the Netherlands, we are currently producing eight well-equipped factories in Iran, and other than the production of industrial and traditional breads We have good exports to the countries of Eastern Europe and Africa.

KhanMohammadi, referring to bread technology in the country, said the export is difficult, and it is kept for 5 days, but we have started exporting bread technology and we are exporting machinery, formulations, personnel and raw materials. Not only is our bread not dependent on foreign countries, but also we can even share the technical knowledge.
